See the changes below in each version: Multiple corrections and updates RELATED PROGRAMS Our recommendations Each developer has their own set of preferences when looking for the appropriate set of tools they will when creating their own programs, and this is especially true when it comes to deciding which IDE to go for. Those who want to write code and make Python-based software have several options at their disposal among them is the editor of Python Stani. Built to ensure all the features one would expect from a full-fledged integrated development environment (IDE), this piece of kit comes with quite a few goodies. First of all, he is designed to act as a code editor, and he has everything a professional would expect from such a program. There are numerous features packed inside Python's editor Stani, so he can take care of just about any task related to coding, editing and management. The built-in researcher class and Python browser will make it easier to find bits of code and components that need to be integrated into the project in development. Pulling support and integrating the PyCrust shell will help you do tasks faster and more accurately. A feature that distinguishes the Python editor from other similar tools is support for Blender. What's more, the package has a special 3D object browser, and another useful feature is the ability to work inside Blender. SPE is currently developed at Ubuntu. CategoryIntegratedDevelopmentEnvironment Semantic Scholar uses AI to extract articles that are important to the topic. I started developing SPE when I was still using Windows back in 2002. Using Python and wxPython, I hoped the spe would run smoothly across all platforms. It was wishful thinking. Fortunately, the community intervened: Linux users started sending me patches and Mac users raised money to buy me a Mac Mini. Years ago I switched to Ubuntu and at that moment I felt joy not choosing a technology that locks you in the same platform. Later, I started developing Phatch (Photo Batch Processor) and used my SPE experience to polish it for Linux, Mac OS X and Windows. I took care of spreading it well on Linux by getting it in major repositories (Debian, Ubuntu, Fedora, Arch, Suse,...). To I didn't have enough time for proper distribution on Mac OS X and Windows. I'm happy to announce that that's going to change. Along with Alramli (another Phatch developer) we have delved deeper into the theme of developing and distributing cross-platform applications. We have come to the conclusion that the study takes longer than the implementation of the code. So we are ready to share our knowledge during our performance at Pycon to save you from hair-pulling behavior. We learned that Python solves 90% of the cross-platform problem for you, but that the remaining 10% can be tricky. In our conversation, we learn the finger on a few painful questions and offer solutions, hoping that they will save you time and disappointment. We prepared a report by writing a paper (sketch here) which is much more extensive than the 30 minutes of conversation will allow us. We have developed a talk to give you a good overview and to get you started. I sent a document to review some people whom I have a lot of respect for. These were some reactions: Great document, I learned new things from it! Peter Ogarovsky (Debian Python Application Package Team) It is a pity that I can not attend PyCon. Anyway, the topics you describe in the paper are rarely analyzed in such depth, and I believe that the entire community will benefit from your presentation. The fun part is properly packing and distributing apps on multiple platforms can be a deep nightmare, and what you have on paper is a great example of how to avoid most hair pulling bugs in this. We will use wxPython as an example of GUI tools, but the principles are valid for other tools. Our target audience is programmers who already have some experience on the same platform, but wonder how everything can be implemented on other platforms. Creating a cross-platform application platform is the most efficient way to scale a user base. Instead of making any bullet point slides, we did our best to make the slides visually entertaining. So even if our voices suddenly turn off, you have something to see. As an spe author I made sure that all code slides have quite a syntax highlight. The combination of pigments with Inkscape rocks! I hope to see you on our conversation on Friday 02:55 pm and Centennial II !
